INTRODUCTION

The Division of Mental Health and Addiction Services (DMHAS) has established an infrastructure to support evidence based prevention through a network of Regional Substance Abuse Prevention Coalitions (RCs). The RCs cover all twenty-one counties through 17 Regional Coalitions and are mobilizing key stakeholders across the state to identify policies, practices and strategies that will reduce substance use among our youth, families and communities. In particular, the RCs are addressing prescription and other opioid use among high-risk populations including student athletes. In collaboration with the New Jersey Prevention Network (NJPN), the RCs have developed the ***Tackling Opioids Through Prevention for Athletes (TOP) Toolkit***. This toolkit provides key information to school administrators and communities to support best practices for student athletes in an effort to reduce the use and misuse of prescription opioids among this high risk population.

In the development of the TOP Toolkit, the Strategic Prevention Framework was utilized to ensure a comprehensive approach was used to meet statewide needs, as well as address the local conditions that contribute to the opioid use among this population in each of the counties. A review of national research for best practices on addressing opioid use among young athletes has been incorporated throughout the TOP Toolkit, as well as state and local resources that are available to support the implementation of best practices and policy recommendations. These recommendations include evidence-based interventions, policies and practices, curriculum-based programs, and more. Also included are locally developed materials and campaigns that schools and community based athletic programs will be able to utilize to decrease risk factors leading to opioid use among young athletes.

The Regional Coalition in your county will provide technical assistance on the use of this toolkit and information to provide trainings, resources and materials to support your efforts in implementing evidence-based programs, policies and interventions directly related to student athletes. Presentations are available to athletic directors, coaches, youth sports program administrators, and school administrators such as principals, superintendents, and boards of education who determine and administer policies within their schools or districts. Trainings may also include making informed medical decisions, using CDC recommendations, and how to advocate for your youth athlete if or when she/he sustains a sports injury will be provided to school nurses, physicians, and parents.

GOAL:

This toolkit is intended to help guide and raise awareness of opioid use and abuse among young student athletes and to provide evidence-based recommendations and information that will encourage and promote policy and practice changes that will strengthen schools, athletic departments and community based athletic programs.

KNOW THE RISKS

On average,
115 Americans die
every day from an
opioid overdose.³

Up to **1 out of 4**
people receiving
long-term opioid
therapy in a primary
care setting
struggles with
addiction.¹

People who are addicted to
prescription opioids are
40X more likely
to be addicted to heroin.⁴

Approximately **3 out of 4**
new heroin users report
having abused prescription
opioids in the past.²

KNOW THE SIDE EFFECTS

Opioids are drugs that work by reducing the intensity of pain signals that reach your brain by interacting with opioid receptors on your nerve cells. These drugs can be helpful for a short time, but they come with a serious risk of addiction. When an opioid binds with nerve cells, along with pain relief, they also affect the brain's reward system which can make people feel euphoric (high).

In addition to the serious risks of overdose and addiction, the use of prescription opioids can have a number of side effects, even when taken as directed. You can develop tolerance to opioids or needing more of the medication for the same pain relief. You can develop physical dependence on opioids: experiencing symptoms of withdrawal, like drug craving, anxiety, insomnia, abdominal pain, vomiting, diarrhea, and tremors, if you suddenly stop taking the medication. Other side effects include constipation, nausea, vomiting, dry mouth, sleepiness, dizziness, confusion, and increased sensitivity to pain.

After taking opioids for just 5 days in a row, a person becomes more likely to take them long-term.⁵

Options that do not involve opioids may provide enough pain relief while avoiding the risks of opioids.⁵

COMMONLY PRESCRIBED OPIOIDS INCLUDE:

PAIN RELIEVERS SUCH AS:

- **MORPHINE** (Roxanol®, Duramorph®, Arymo® ER, Kadian®, MorphaBond® ER, MS Contin®)
- **CODEINE** (Tylenol® With Codeine)
- **OXYCODONE** (OxyContin®, Roxicodone®, Percocet®, Tylox®, Percodan®, Oxaydo®, OxyFast®, Xtampza® ER)
- **HYDROCODONE** (Lortab®, Vicodin®, Paracetamol®, Lorcet®, Tussionex®, Norco®, Zohydro® ER, Hysingla® ER)
- **OXYMORPHONE** (Opana®, Numporhan®)
- **HYDROMORPHONE** (Dilaudid®, Exalgo®, Palladone®)
- **MEPERIDINE** (Demerol®, Pethidine®, Meperitab®)
- **TRAMADOL**
- **FENTANYL** (Duragesic®, Subsys®, Lonsys®, Abstral®, Lazanda®, Fentora®)
- **METHADONE** (Dolophine®, Methadose®)
- **BUPRENORPHINE** (Subutex®, Butrans®, Suboxone®, Belbuca®, Buprenex®)

Information taken from drugs.com

PURPOSE

Prescription drug and heroin abuse is a major problem affecting millions of people in the United States. Drug overdose has become the leading cause of injury death in the United States, surpassing the number of deaths due to homicides and car accidents¹.

Prescription drugs, specifically opioids, are one of the most commonly abused substances by teens 14 years and older in the United States. In 2015, an estimated 276,000 adolescents were non-medical users of pain relievers, with 122,000 being addicted to these substances². As the number of prescribed opioid medications rise, there are increased concerns about the risks associated with opioid use, including misuse, abuse, addiction, and overdose. These trends have been on the rise throughout recent years and are projected to increase unless we act now. Likewise, current research shows that it is imperative to intervene in the drug abuse process as early as possible to prevent future issues.

“Young adults who participate in athletics may be at a greater risk to engage in nonmedical prescription opioid use because of their greater risk of injury or because of a greater opportunity to receive diverted opioid medications from teammates.”

Several studies have found that youth who are highly involved in competitive sports are at a greater risk of being prescribed opioid medications, misusing opioid medications (e.g., use to “get high”), and being approached to divert (e.g., give away) these opioid medications³. A study of 1,540 adolescents conducted by the Institute for Research on Women and Gender (IRWG) in Ann Arbor, Michigan, found that participating in high school sports made it more likely that young men had taken and misused an opioid prescription within the last year compared to their non-athlete peers.

Furthermore, a national study found that youth who participated in high-injury sports such as football and wrestling were at greater risk to misuse prescription pain medications. The greater risk to misuse opioid medications may be related to the fact that football players and wrestlers have the highest severe injury rates among high school athletes and may be more likely to have been prescribed opioid medications by a physician³. In addition, youth who participate in high-injury sports may be surrounded by peers who are more likely to have leftover prescription opioids, making it easier to receive diverted prescription opioids to ease injuries without having to acknowledge to parents and coaches that they need medical attention (e.g., hiding injuries from coaches to participate)³.

There are 300,000 high school student-athletes in NJ and the Partnership for a Drug Free NJ’s (PDFNJ) study found that less than 50% of their parents feel they are knowledgeable about heroin⁴. Doctor prescribed opioid use before high school graduation increases the risk of future opioid misuse after high school by 33%⁵.

As we look upstream to the many paths to addiction, a prescription for pain medication due to a sports injury can be the first step to addiction. Adolescents involved in organized sports may be more likely or at a higher risk to misuse opioid medications because of their increased risk for injury. Despite the positive benefits young athletes gain from participating in organized sports, sports participation may actually put some adolescents at risk for substance use because of increased access to pain medications. Given the elevated risk of injury, adolescents who participate in organized sports would be more likely to have been prescribed opioid medications compared to their non-participating peers. The **Tackling Opioids Through Prevention for Athletes Toolkit** has been developed to help support schools and communities respond to addressing this opioid epidemic among this high risk group.

RESEARCH

Though prescription drugs can be the first step to addiction for our youth, alcohol, marijuana and other drugs can also be the first step to a path to addiction.

The Trust for American's Health and Well Being report, The Pain in the Nation: The Drug, Alcohol and Suicide Crises and the Need for a National Resilience Strategy⁶, states:

"One thing is clear: there is an immediate need to develop an actionable national response to alcohol and drug misuses and death by suicide. Not only are these urgent health crises across this country, they are indicators of the need to go deeper and to look at underlying causes and opportunities to create an integrated approach to well-being for all people, and especially for those who are at a high risk for experiencing these challenges."

The report goes on to say, "Many of the strategies to address the opioid epidemic have focused on trying to limit the supply of prescription and illicit forms of opioids along with measures to respond to overdoses and attempts to try to address major gaps in the country's substance use disorder treatment capabilities, rapidly attempting to expand and modernize the types of treatment available to those in need. However, these efforts are inherently insufficient and will not succeed unless there are corresponding efforts to address the broader issues that contribute to adverse well-being and underlying pain. The rise of multiple despair deaths and related trends show there is a more significant dynamic that needs to be addressed. While the availability of drugs and alcohol does contribute to higher use, there are many other factors that contribute to substance misuse and risk for suicide including family and social relationships, social-emotional development, Adverse Childhood Experiences (ACEs), and the "lack of economic opportunity, poor working conditions and eroded social capital in depressed communities, accompanied by hopelessness and despair."

Annual Deaths from Alcohol, Drugs and Suicide 1999-2016

"In addition, causation goes in both directions substance misuse and untreated mental health issues can adversely impact health, academic and career attainment, relationships with family and friends and the ability to be a connected part of a community."

With this scope in mind, the TOP Toolkit highlights a direct response to the opioid crisis but also recognizes the broader perspective needed to address the root of the addiction crisis we are facing. The TOP Toolkit addresses some of the recommendations for Building a National Resilience Strategy, including a range of policies and programs available to inform an effective, comprehensive continuum approach from prevention and early identification and connection to services and supports to treatment and recovery.

www.healthyamericans.org/assets/files/TFAH-2017-PainNationRpt-FINAL.pdf

KNOW THE LAW

Legislation is an important component in the overall comprehensive prevention approach. Many interventions are designed to focus on individuals and assist in developing skills needed to make healthy decisions. Other approaches focus on the environment that supports healthy behaviors. Research indicates that the most effective approaches incorporate multiple strategies. The legislation section of this Toolkit looks at the policy strategies that change the conditions within a community. However, it is important to keep in mind that without enforcement, laws and policies are unlikely to be successful. The following are laws to be aware of.

REQUIREMENT FOR ALL NEW JERSEY SCHOOL SYSTEMS

STATE OF NEW JERSEY
DEPARTMENT OF EDUCATION

Opioid Use and Misuse Educational Fact Sheet

As of March 2, 2018, the New Jersey Department of Education (NJDOE) released N.J.S.A.18A:40-41.10/P.S. 2017, c 167 which began requiring public school districts, approved private schools for students with disabilities, and nonpublic schools participating in an interscholastic sports program to distribute their Opioid Use and Misuse Educational Fact Sheet to all student-athletes and cheerleaders. In addition to distributing the fact sheet, schools and districts must obtain a signed acknowledgement of receipt of the fact sheet from each student-athlete and cheerleader, and for students under the age of 18, the parent/guardian must also sign. The form must be distributed and the sign-off sheet completed and returned before the first official practice session of the season can occur. This process must occur annually.

The intent of this law is to ensure, “that young people and their parents are educated as early as possible about the dangers of opioid abuse and addiction. It is critical to provide this information to students who participate in athletics to make certain that, in the event they are prescribed an opioid for an injury, they will be fully knowledgeable of the risks of misuse.”

Important notes:

- This Sign-Off form cannot be combined with any other sign-off sheets.
- This process must occur annually before the beginning of the first official practice session of the season.

Instructional Programs on drugs, alcohol, anabolic steroids, tobacco and controlled substances

The need for prevention and intervention efforts surrounding student alcohol, tobacco, and other drug (ATOD) abuse is paramount to the goal of keeping our students safe, healthy, and in school. In support of these efforts, each district board of education is required to establish a comprehensive program of prevention, intervention, referral for evaluation, referral for treatment and continuity of care for student ATOD abuse (N.J.S.A. 18A:40A-10 and N.J.A.C. 6A:16-3, 6A:16-4 and 6A:16-6). Fostering an environment where students can develop protective factors and resiliency skills is essential in decreasing the prevalence and occurrence of student ATOD abuse and related at-risk behaviors.

Limitations on Prescribing, Administering, or Dispensing of Controlled Dangerous Substances, and Special Requirements for Management of Acute and Chronic Pain

In May 2017, the N.J.A.C. 13:37-7.9A was amended to provide new requirements for practitioners when issuing controlled substances such as opioids.

These new requirements include accessing the Prescription Drug Monitoring Program ([see box below](#)) to review a patient's prescription history, **discussing with the patient, or the patient's parent or guardian (if the patient is under 18 years of age and is not an emancipated minor) the reasons why the medication is being prescribed, the possible alternative treatments, and the risks associated with the medication. With respect to opioid drugs, the discussion shall include, but not be limited to, the risks of addiction, physical or psychological dependence, and overdose associated with opioid drugs and the danger of taking opioid drugs with alcohol, benzodiazepines, and other central nervous system depressants, and requirements for proper storage and disposal.**

With regard to prescriptions for opioid drugs, practitioners are not permitted to issue an initial prescription for an opioid drug for treatment of acute pain in a quantity exceeding a 5 day supply.

Overdose Protection Act and Lifeline Legislation

The Overdose Protection Act of NJ: Rev Stat § 2C:35-30 (2013) is intended to save lives by encouraging people to seek medical assistance whenever a drug overdose occurs. It does so by providing that those who, in good faith, seek medical assistance for an overdose victim will be immune from arrest and prosecution on a charge of use or simple possession of illegal drugs. The immunity also applies to the person suffering the overdose.

Additionally, the lifeline legislation (P.L. 2009, c.133) encourages young people to call for help in the event of an alcohol medical emergency. This legislation provides immunity from prosecution when these steps are followed: (1) Calling for help, (2) Staying with your friend, (3) Talking with Authorities. The underage person who is receiving medical assistance is also immune from prosecution. This immunity applies on public and private property.

The New Jersey Prescription Monitoring Program (NJMP) is an important component of the New Jersey Division of Consumer Affairs' (Division) effort to halt the abuse and diversion of prescription drugs. The NJMP, established pursuant to N.J.S.A. 45:1-45 et. seq., is a statewide database that collects prescription data on Controlled Dangerous Substances (CDS) and Human Growth Hormone (HGH) dispensed in outpatient settings in New Jersey, and by out-of-state pharmacies dispensing into New Jersey. The NJMP also serves as an effective tool for identifying those who fraudulently obtain prescription drugs or are otherwise involved in the criminal diversion of prescription medication.

NJ REGIONAL COALITIONS

Seventeen regionally-based prevention coalitions are working together to reduce the use and misuse of alcohol and drugs among the citizens of New Jersey. These county-wide coalitions are committed to collaborating with community partners including municipal alliances, law enforcement, faith-based organizations, schools, treatment agencies, local legislators, health departments, healthcare providers and other local level community agencies to make New Jersey a healthier place to live.

The Regional Coalitions (RC) focus on the following:

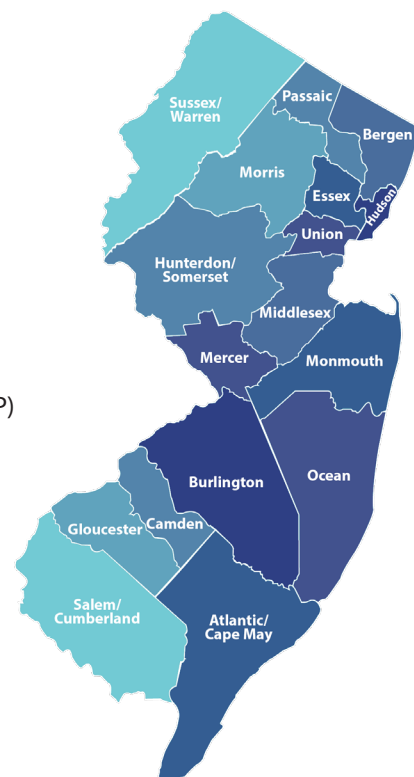

1. Reduce underage drinking
2. Reduce the use of illegal substances - with a special focus on reducing the use of opioids
3. Reduce prescription medication misuse across the lifespan
4. Reduce the use of new and emerging drugs of abuse across the lifespan

In 2018, Regional Coalitions have expanded their prevention efforts to focus on young athletes and the use/misuse of opioids. These coalitions have provided presentations, resources, and technical assistance in their communities.

The Regional Coalition in your region will provide technical assistance on the use of the TOP toolkit and to learn more about trainings, resources and materials to support your efforts in implementing evidence-based programs, policies and interventions directly related to student athletes. Presentations are available to athletic directors, coaches, youth sports program administrators, and school administrators such as principals, superintendents, and boards of education who determine and administer policies within their schools or districts. Training on CDC Guidelines and how to advocate for your youth athlete if or when she/he sustains a sports injury will be provided to school nurses, physicians, and parents.

The following is a list of New Jersey's Regional Coalitions and their respective counties:

- **Atlantic and Cape May Counties** Join Together Atlantic County and Cape May County Healthy Community Coalition
- **Bergen County** – Bergen County Prevention Coalition
- **Burlington County** – Burlington County Coalition for Healthy Communities
- **Camden County** – Community Alliance Network (C.A.N.) Drug Free Community Coalition
- **Cumberland and Salem Counties** – Salem-Cumberland Regional Action Toward Community Health (SCRATCH)
- **Essex County** – Alcohol & Drug Abuse Prevention Team (ADAPT)
- **Gloucester County** – Gloucester County Regional Substance Abuse Prevention Coalition (GRASP)
- **Hudson County** – Hudson County Coalition for a Drug-Free Community (HCCDFC)
- **Hunterdon and Somerset Counties** – Safe Communities Coalition of Hunterdon and Somerset County
- **Mercer County** – Prevention Coalition of Mercer County (PCMC)
- **Middlesex County** – The Coalition for Healthy Communities
- **Monmouth County** – Prevention Coalition of Monmouth County
- **Morris County** – Community Coalition for a Safe and Healthy Morris (CCSHM)
- **Ocean County** – DART Prevention Coalition
- **Passaic County** – United for Prevention in Passaic County (UPinPC)
- **Sussex and Warren Counties** – Coalition for Healthy and Safe Communities
- **Union County** – Health and Wellness Coalition of Union County (HAWC)

STATEWIDE INITIATIVES

Stop Opioid Abuse Program (SOAP) is a joint effort between the New Jersey State Interscholastic Athletic Association (NJSIAA) and the Garden State Pharmacy Owners (GSPO). Capitalizing on the health science expertise of GSPO members, and the extensive communication network of NJSIAA, this initiative will be able to provide life-saving information to all of New Jersey's 300,000 high school student-athletes. SOAP will begin regularly sharing student-focused informational materials with public, private, and parochial schools across New Jersey. Schools will have the opportunity to determine how to best distribute the information to their athletes, coaches, and trainers. Additional components of the SOAP initiative include community outreach, regular updates to, and interaction with state legislators and drug manufacturers, and other volunteers by GSPO members. For more information about the GSPO, visit <http://www.gspo.org/>

The Partnership For A
Drug-Free New Jersey

The Partnership for a Drug-Free New Jersey (PDFNJ) set out to enlist the help of one key player in the fight against opioid abuse - PARENTS. PDFNJ is addressing this issue with their "Before They Prescribe - You Decide™" campaign. This campaign is geared toward educating parents on the link between prescribed pain medicine and heroin abuse and encouraging and empowering them to speak to their doctor or dentist about the potential addictive qualities of pain medicine prescribed, as well as possible alternatives to opioids that are appropriate. Many of the images from this multimedia educational campaign are included in this toolkit and can be accessed at <http://www.drugfreenj.org/beforetheyprescribe/>

DID YOU KNOW?

There are medication drop boxes throughout New Jersey that provide a safe alternative for disposing of your unused, expired, or unwanted prescription medications. Follow these links to find a drop box near you or go to the appendix for your county's locations.

NJ's Project Medicine Drop boxes are installed indoors, affixed to the floor or wall in a secure area within police department headquarters, within view of law enforcement officers, in an area to which members of the public may be admitted to dispose of their unused medications year-round.

Visit <https://www.njconsumeraffairs.gov/meddrop/Pages/default.aspx> to learn more about this initiative.

The American Medicine Chest Challenge is a community based public health initiative, with law enforcement partnership, designed to raise awareness about the dangers of prescription drug abuse and provide a nationwide day of disposal – at a collection site or in the home - of unused, unwanted, and expired medicine that will be held on the second Saturday of November each year in communities across the country.

Visit <http://www.americanmedicinechest.com/> to learn more about this initiative.

The National Prescription Drug Take Back Day events provide an opportunity for Americans to prevent drug addiction and overdose deaths. Take Back Days occur twice a year, one event in the spring and one event in the fall. Please note that some drop box locations may be temporary for these events.

Visit <https://takebackday.dea.gov> to learn more about this initiative.

BEST PRACTICES

The research that guides the prevention field supports a comprehensive multi-strategy approach. A singular program alone could not address the complex problem of substance use among youth. The following section highlights examples of Best Practices that assist in building an effective response. This is not an exhaustive list. Please contact your Regional Prevention Coalition for additional examples.

- The policy examples provided create supportive practices to help identify students in need and provide early intervention support.
- The educational program examples provided compliment evidence based strategies that promote proven effective multi-lesson/multi-skill building sessions rather than onetime assemblies that prove to be counterproductive and not effective for evoking positive behavioral change.
- The community-based awareness campaign included, offer examples of positive promotion and messaging.

Your local Regional Prevention Coalition can work with your school or community to create a comprehensive strategy that best fits your needs. In addition to the Regional Coalition in your area, there may be a Municipal Alliance funded by the Governor's Council on Alcoholism and Drug Abuse (GCADA) or a Drug Free Community Coalition funded by the Center for Substance Abuse Prevention (CSAP) that are a valued resource to assist your efforts.

Working with your Regional Coalition and other stakeholders in your community will assist you in connecting your efforts with their initiatives to maximize your results through braided funding and resources within your community. This collaboration with existing coalitions helps to ensure the implementation of an effective comprehensive approach.

What are Best Practices in the prevention field?

Tackling Opioids Through Prevention for Athletes (TOP) toolkit provides key information to support school administrators and communities implement best practices for student athletes in an effort to reduce the use and misuse of prescription opioids among this high risk population. The following are recommendations to create a comprehensive, evidence based response to the addiction crisis New Jersey is facing.

A comprehensive response is imperative to creating real solutions to the problem. An evidence based approach can be guided by the CADCA's (Community Anti- Drug Coalitions of America) Strategies for Community Change. These seven CADCA Strategies directs our efforts to be much more than just information sharing.

Strategies for Community Change

1. Providing Information
2. Enhancing Skills
3. Providing Support
4. Enhancing Access/Reducing Barriers
5. Changing Consequences (Incentives/Disincentives)
6. Physical Design
7. Modifying/Changing Policies

These strategies frame out the need to provide information, but, change policies and practices to create supportive policies not punitive ones, and recognize that one's path to addiction can have many different starting points.

The Regional Coalition in your county can provide you with technical assistance on developing an evidence based comprehensive approach that will reduce the risk of a substance use disorder among your students and create a supportive, informed initiative that supports your school community.

The research that guides the prevention field supports a comprehensive multi-strategy approach. One program is not going to address this complex problem of substance use among our youth. This Best Practice section highlights some examples of the intervention that can begin to build an effective response. This is not an exhaustive list and your Regional Coalition can provide additional examples for consideration. Some examples provided are policies that can create supportive practices to help identify students in need and provide early intervention support. Other examples are evidence based educational programs to utilize rather than the ineffective one—time assemblies that are not effective. We have also included community-based awareness campaign as well. Your local Regional Coalition can work with your school or community to create a comprehensive strategy that best fits your needs.

There are prevention efforts happening through collaborations and coalitions in your community and region. Besides the Regional Coalition in your area, there may also be a Municipal Alliance which is funded by the Governor's Council on Alcoholism and Drug Abuse (GCADA) or a Drug Free Community Coalition funded by the Center for Substance Abuse Prevention (CSAP). Working with your Regional Coalition and other stakeholders in your community will assist you in connecting your efforts with these other initiatives, maximize your efforts by braiding the funding and resources available in your community and ensures the implementation of an effective comprehensive approach.

Prevent Rx Abuse Prevention Toolkit:

CADCA's Online Rx Abuse Prevention Toolkit contains facts, strategies and tools to prevent and reduce teen Rx medicine abuse in your community. This newly revised toolkit is based on CADCA's Seven Strategies for Effective Community Change. Incorporating these strategies will help you formulate, modify and implement your prevention and intervention strategies.

To access this toolkit, visit <http://www.preventmedabuse.org/>

IF YOU WOULD LIKE TO UTILIZE ANY OF THE RESOURCES FOUND IN THIS SECTION,
REACH OUT TO YOUR REGIONAL COALITION TO LEARN MORE

continued...

Screening, Brief Intervention & Referral to Treatment (SBIRT):

The Substance Abuse and Mental Health Services Administration (SAMHSA) defines Screening, Brief Intervention and Referral to Treatment (SBIRT) as a comprehensive, integrated evidence-based public health approach and model for identifying substance misuse and delivers early intervention services for persons at risk of developing substance use disorders. SBIRT is an identified “best practice” by the Institute of Medicine since 2001 and is recommended by the US Preventive Health Services Task Force.

SBIRT is implemented universally to all patients or all students and schools. It provides an opportunity for health providers to take proactive measures for individuals engaged in risky use of substances – but who are not currently in need of nor seeking treatment. SBIRT utilizes a rapid and simple set of procedures to affect the public health burden of substance abuse. SBIRT provides the opportunity for individuals to connect with help or support in a safe environment and by a trained, caring provider. Without programs like SBIRT, many teens never directly discuss aspects of their own behavioral or mental health. The use of SBIRT provides opportunities for early intervention with at-risk populations before more severe consequences occur. Additionally, the use of SBIRT provides:

- Quick assessment of the severity of one's substance use/misuse;
- Immediate filter of non-problem users;
- Identification of those who would benefit from brief education and reinforcement of healthy behaviors;
- Increase in one's insight and awareness of substance use/misuse; motivates toward behavioral change
- Identification of risk level and of those who would benefit from higher levels of care
- Referral to specialty care for further assessment of those at high substance use risk

A policy to implement SBIRT in your school is an effective strategy to address this crisis. According to Pain in the Nation, SBIRT provides a systematic means of identifying and providing appropriate services to people who clearly need, but are not receiving, treatment. Massachusetts passed a law in 2016 requiring public schools to verbally screen middle and high school students for substance use disorders using a validated screening tool.³⁶ The use of this tool enables school health teams to detect risk for substance-use related problems and deploy brief intervention strategies to address these concerns at an early stage.

Adverse Childhood Experiences (ACEs):

Adverse Childhood Experiences can have a profound impact on the physical, mental, behavioral and social-emotional health throughout an individual's lifespan. ACEs increase a child's risk for a series of health and social problems - including increased risk for substance misuse.

“Young people exposed to Adverse Childhood Experiences (ACEs) -- stressful, traumatic events -- are more likely to develop substance use disorders as adults. Children whose parents misuse drugs or alcohol are also at increased risk of experiencing other ACEs, including emotional abuse and neglect. ACEs linked to an earlier age of initiation of alcohol use, a greater likelihood of serious problems with drugs and increased odds of attempting suicide, and social, emotional and cognitive impairment, lower academic achievement and lower educational attainment.” SOURCE: Pain in the Nation

Research has shown that building supporting protective factors, such as the following, can help reduce the risk of ACEs:

- Parental Resilience
- Social Connections
- Knowledge of Parenting and Child Development
- Concrete Support in Times of Need
- Social and Emotional Competence of Children

To enhance both academic and behavioral outcomes, school leaders can implement policies and practices such as Positive Behavioral Interventions and Supports (PBIS) models that rely on positive rather than punitive approaches to student misbehavior. Research indicates these approaches contribute to reduced problem behavior, decreased bullying, less illegal substance use and increased graduation rates.

“Educators and administrators can engage community partners, improve school climate, help screen students to identify risk of mental and behavioral health concerns, ensure schools have well-trained health personnel and provide training to support a school culture of well-being.” SOURCE: Pain in the Nation: Education Brief

Athletes Targeting Healthy Exercise & Nutrition Alternatives (ATHENA)/Athletes Training and Learning to Avoid Steroids Program (ATLAS):

The ATHENA program uses a school-based, team-centered format that aims to reduce disordered eating habits and deter use of body-shaping substances among middle and high school female athletes. The intervention includes a balanced presentation concerning the consequences of substance use and other unhealthy behaviors and the beneficial effects of appropriate sport nutrition and exercise training. ATHENA also incorporates cognitive restructuring appropriate to a sport team setting to address mood-related risk factors for diet pill use.

The ATLAS program is designed for male high school athletes to deter drug use and promote healthy nutrition and exercise as alternatives to drugs. This school-based drug prevention program includes: (1) discussion of sports nutrition; (2) exercise alternatives to anabolic steroids and sports supplements; and (3) the effects of substance abuse in sports, drug refusal role-playing, and the creation of health promotion messages.

These programs were created by the Oregon Health & Science University in Portland. Visit <https://www.ohsu.edu/xd/education/schools/school-of-medicine/departments/clinical-departments/medicine/divisions/hpsm/research/atlas-and-athena-program.cfm> to learn more. (Fees may apply)

Botvin Life Skills Training:

The new LifeSkills Training Prescription Drug Abuse Prevention Module gives adolescents the skills and knowledge necessary to help them avoid the misuse/abuse of opioids and prescription drugs. This module is ideal for school districts, community-based organizations, and agencies serving students in grades 6 – 9. Students will develop skills to: Recognize that prescription drugs are medications intended to help people deal with medical problems; Recognize that prescription drugs—and, in some cases, over-the-counter medicines—can be abused; Identify why people do or do not abuse prescription drugs (including opioids); Learn and practice effective refusal techniques. This curriculum is available in both digital and print formats. For more information, visit www.lifeskillstraining.com (Fees may apply)

#ChangeTheScript Campaign:

**Don't let opiate
addiction
'STRIKE' you out!**

#ChangeTheScript

Ask your doctor about safer
alternatives to opiates.

www.instituteforprevention.com

DART Prevention Coalition
Institute for Prevention | RWJBarnabas Health

**Other slogans used in
this campaign include:**

Don't let opiate addiction
'TOUCH DOWN' in your family!

'KICKING' out opiate
addiction in our town!

Don't 'WRESTLE' with
opiate addiction!

Injury puts you on the bench,
addiction ends your career!

The DART Prevention Coalition's #ChangeTheScript campaign was created by the Prescription Misuse Workgroup with the goal of educating parents on the dangers of prescription drug abuse and potential alternatives to opioids. The signs are meant to be a permanent fixture at schools and athletic facilities. Each sign was developed to have an eye-catching phrase related to specific sports. DART partnered with local municipal alliances, school districts, parks and recreation departments, and police departments to place the signs throughout Ocean County. The signs send an ongoing, unified message that prescription drug abuse amongst student athletes is an issue parents need to be aware of. Contact the DART Prevention Coalition to learn more about this initiative.

In a Split Second:

This documentary was created by Safe Communities Coalition of Hunterdon and Somerset County to show how split second decisions can change the lives of many when it comes to choices with alcohol, driving, and prescription drugs. To view, visit: <https://www.youtube.com/watch?v=7l4bChEdOqE>

Operation Prevention:

**OPERATION
PREVENTION**

The Drug Enforcement Administration (DEA) has joined forces with Discovery Education to create a comprehensive, NO-COST, science-based program for young people, ages 8–18, to combat opioid misuse— available TODAY in every school, home, and state in the nation to kick-start life-saving actions. Elementary, middle, and high school classroom-ready lessons and companion guides provide educators with standards-aligned, science-based tools to integrate seamlessly into classroom instruction. In this self-paced, standards-aligned e-learning experience, young people explore the science of opioid misuse and build strategies they can employ when faced with a decision about the use of prescription medications. Visit www.operationprevention.com to learn more.

Pills to Heroin:

This documentary was created by Safe Communities Coalition of Hunterdon and Somerset County to show the devastating effects and journey of Prescription drug abuse and the move to Heroin. To view, visit: <https://www.youtube.com/watch?v=39LYHtcWVHk>

Smart Moves, Smart Choices:

Smart Moves, Smart Choices is a national awareness program designed to inform parents, teens and educators about the risks of teen prescription drug abuse and misuse, and to empower them to address this serious problem. A partnership between the National Association of School Nurses and Janssen Pharmaceuticals, Inc., the program offers free tools and resources to help empower schools and communities to begin a dialogue with elementary, middle and high school students and their parents and relatives. The program encourages parents and relatives to monitor their medicine cabinets and to have open and honest conversations with their children. The more young people learn about the dangers of prescription drug abuse and misuse, and proper use of medicines, the better prepared they can be to make good decisions and smart choices.

Visit www.smartmovesmartchoices.org to learn more.

Student Assistance Programs:

The Student Assistance Professionals of New Jersey define Student Assistance programs as a comprehensive framework for the delivery of K- 12 universal, targeted prevention/ intervention strategies and programs. Student Assistance services are designed to address risk factors, promote protective factors and increase overall success. Student Assistance Programs address barriers to learning that impact the individual student in order to increase student success while improving school climate. Student Assistance Programs partner with parents, students, school resource officers, other school faculty, community coalitions, agencies and services in seeking to remove barriers that impede student success. The New Jersey Department of Education has established specific criteria required for individuals to become certified Student Assistance Coordinators (SAC). These criteria ensure that the SAC is qualified to provide substance abuse/mental health prevention, intervention, counseling and related services. On-going professional development ensures that SACs remain up-to-date on current research, trends, techniques, and community resources.

Visit <http://asapnj.org/> to learn more.

The Medicine Abuse Project:

A campaign by The Partnership at DrugFree.org called The Medicine Abuse Project, draws attention to just how big a problem prescription drug use has become, and is ambitious in its purpose: to prevent half a million teens from abusing medicine within the next five years. To realize such a goal, they have enlisted partners like CVS Health to help get the word out to families, industry, communities, health care professionals and educators. On their website, people can take a pledge to help stop prescription drug abuse. They can also watch heartfelt video testimonials about families who have faced prescription drug addiction first hand. Visit <https://drugfree.org/medicine-abuse-project/> to learn more.

How Directors & Coaches Can Help

The following information was provided by the Massachusetts Technical Assistance Partnership for Prevention (MassTAPP):

What to do when sports injuries occur:

- Be honest about the limitations and discomfort that injuries pose. Pain exists for a reason. Ignoring it or masking it with drugs is not in the athlete's best interest.
- Return-to-play decisions should be determined by the medical professionals involved with the injured athlete, such as physicians, athletic trainers, or other outside professionals—not the athlete, coach, or athlete's parents. However, it is important to keep lines of communication open between these parties.
- Document the treatment and return-to-play plan, and share it with all parties involved in an injured athlete's care and sports participation.
- An injured athlete needs time to heal. Missing a game or two is better than missing an entire season or more.

Consider the injured athlete's social and emotional health:

- Sports injuries can have an impact on the social and emotional life of a student athlete. Being sidelined and losing a structured activity may lead to depression, loss of connection to friends, and loss of identity as an athlete. Speak with injured athletes about how they can stay involved with the team even if they are not able to get back on the field.
- Coaches and trainers are in a position to develop close relationships with student athletes. These connections can provide valuable guidance, support, and mentorship, and can make a profound difference in the lives of young people. Use these relationships to add personal impact to the rules and expectations about drug use that guide interscholastic sports.

What to do if an injury occurs and pain management is needed:

- Students and their families should talk openly with their health care providers about the medications, their proper use, possible risks and side effects, and any alternatives.
- Medication should be left at home or dispensed by school nurses (as required by law).
- Medications should not be shared with anyone.
- Mindfulness techniques, relaxation exercises, and physical therapy can also assist in pain management.
- Opioids for pain should be considered only by a medical provider—and only when other approaches have not provided relief. Consider ice, heat, rest, or over-the-counter non-steroidal anti-inflammatory medications, as appropriate.

How Athletic Trainers Can Help

The following information was provided by the National Athletic Trainers Association (NATA):

Athletic trainers can play an important role in promoting safe opioid use and preventing opioid abuse. While participation in sports decreases the likelihood that a student will abuse illicit drugs, sports injuries often result in a student being prescribed a pain medication, putting student athletes at a higher risk for abusing those opioid-related medications. Below are a few suggestions on what athletic trainers can do about this important issue:

Increasing Athletic Trainer Presence:

Only an estimated 37% of high schools employ a full-time athletic trainer. NATA supports proposals to ensure that every high school with an athletics department has a full-time athletic trainer on staff to monitor the health of student athletes.

Sharing Information, Sharing Responsibility:

Athletic trainers are uniquely positioned to help with the prevention of opioid abuse and successful rehabilitation from injury amongst student athletes. If a student athlete is prescribed an opioid, the athletic trainer at his or her school should be informed so they can assist with monitoring the student's usage and recovery progress.

Empower Athletic Trainers to Stop Overdoses:

Opioid overdoses can be reversed when the lifesaving drug naloxone is promptly administered. NATA supports proposals to increase access to and training in administering naloxone, including amongst athletic trainers, who often are at the front line of care for athletes.

How Nurses Can Help

The following information was provided by the New Jersey Division of Mental Health and Addiction Services (NJDMHAS):

What is Naloxone?

Naloxone is a prescription medicine that is used to reverse an opioid overdose. Opioids include heroin and prescription pain medications such as morphine, hydrocodone, and oxycodone. Naloxone is safe and effective; medical professionals have used it for decades. Naloxone also goes by the brand names of “Narcan” and “Evzio”.

How Does Naloxone Help?

Naloxone is an antidote to opioid drugs. Opioids can slow or stop a person’s breathing, which can lead to death. Naloxone helps the person wake up and continue breathing. An overdose death may happen hours after taking drugs. If a bystander acts when first noticing a person’s breathing has slowed, or when the person will not wake up it is time to call 911 and start rescue breathing (if needed) and administer naloxone.

Because the drug naloxone can reverse an opioid overdose, some people want to make it available where a lot of young people can be found: public schools. In most schools in the U.S., if a teen has an overdose, nurses can call 911 and perform rescue breathing until EMS arrives—but when it comes to reversing an opioid overdose, seconds count.

Some states have started to authorize schools to have naloxone handy if they need it. The National Association of School Nurses has endorsed the idea.

In June 2018, New Jersey passed a law that “requires certain schools to maintain supply of opioid antidotes and permits emergency administration of opioid antidote by school nurse or trained employee”. For more information on this law, visit http://www.njleg.state.nj.us/2018/Bills/A1000/542_R1.PDF

How Parents Can Help

The following information was provided by the Partnership for Drug-Free Kids and Operation Prevention:

What is prescription medicine abuse?

Prescription (Rx) medicine abuse is the use of an Rx medicine to create an altered state, to get high, or for any reasons other than those intended by the prescribing doctor.

How many teens are doing this?

According to research conducted by the Partnership for Drug-Free Kids, one in four teens say they have taken a prescription medicine – that was not prescribed to them — at least once in their lifetime. This behavior cuts across geographic, racial, ethnic and socioeconomic boundaries.

Why are some teens doing this?

Teens are engaging in this dangerous behavior for a variety of reasons. In some cases, they do it to party and get high, but also to manage stress or regulate their lives. Some are abusing prescription stimulants used to treat attention deficit hyperactivity disorder (ADHD) to provide additional energy and the ability to focus when they're studying or taking tests. Many teens are abusing pain relievers and tranquilizers to cope with academic, social or emotional stress.

What are the risks?

There are both immediate and long-term risks to medicine abuse. In the short term, overdosing can be fatal, as can mixing Rx medicine with over-the counter medicine and/or alcohol. In the longer term, prescription opioids (pain relievers) and other prescription medicines have been proven to be potentially addictive. Relying on Rx medicines at a young age to help “manage” life can establish a lifelong pattern of dependency and prevent teens from learning important coping skills.

Where are teens getting prescription medicine?

According to the Partnership for Drug-Free Kids Survey, Two-thirds (66 percent) of teens who report abuse of prescription pain relievers are getting them from friends, family and acquaintances. Some teens share Rx medicines among themselves —handing out or selling their own pills or those they've acquired or stolen from classmates. A very small minority of teens also say they get their prescription medicine illicitly from doctors, pharmacists or over the internet.

- Educate yourself. Visit drugfree.org and MedicineAbuseProject.org for information, tools, resources and support.

-Communicate the risks of prescription medicine abuse to your kids. Children who learn a lot about the risks of drugs at home are at least 20 percent less likely to use drugs than those who do not get that critical message from their parents.

-Safeguard your medicine. Keep prescription medicine in a secure place, count and monitor the number of pills you have and lock them up — and ask your friends and family members to do the same.

-Get help. If you think your child has a problem with prescription medicine abuse, please visit drugfree.org/get-help or call the Parents Toll Free Helpline to speak to a parent specialist at 1-855-DRUGFREE (1-855-378-4373)

BEFORE IT BEGINS

Remember, parental supervision is a strong influence for preventing opioid misuse and abuse.

Teens who are left with long periods of unsupervised time are at greater risk. That can be challenging since teens begin to spend more time with friends and less with family. However, it is important to stay aware of what your child is doing. Ask questions when something does not seem right and check up on your child to ensure they are where they say they are.

Check the medicine cabinets in your home and make sure there are no unfinished or outdated prescription medications.

Get rid of any unused prescription medications that are expired or no longer active. If you have any unused prescription medications, this toolkit provides some national and local resources on page 11 and in Appendix A.

FIND YOUR COUNTY DROPBOX LOCATIONS IN APPENDIX A

Perhaps most importantly, maintain frequent lines of communication.

The more open you are to hearing what your children have to say or ask (even if it's not what you want to hear), the more likely they are to communicate with you. It's important to maintain healthy, trusting relationships they know they can count on. Attend any open events at school about drugs and drug use, use these events as starting points for additional communication and participate in activities as a family in healthy, drug-free environments.

APPENDIX A

Local Resources

Educational Materials

The following resources are available for use in this section of the toolkit:

- NJDOE Opioid Use and Misuse Educational Fact Sheet
- CDC Guidelines for Prescribing Opioids for Chronic Pain
- Stop Opioid Abuse Program (SOAP) Materials
- Get the Facts (CDC)

OPIOID USE AND MISUSE EDUCATIONAL FACT SHEET

Keeping Student-Athletes Safe

School athletics can serve an integral role in students' development. In addition to providing healthy forms of exercise, school athletics foster friendships and camaraderie, promote sportsmanship and fair play, and instill the value of competition.

Unfortunately, sports activities may also lead to injury and, in rare cases, result in pain that is severe or long-lasting enough to require a prescription opioid painkiller.¹ It is important to understand that overdoses from opioids are on the rise and are killing Americans of all ages and backgrounds. Families and communities across the country are coping with the health, emotional and economic effects of this epidemic.²

This educational fact sheet, created by the New Jersey Department of Education as required by state law (*N.J.S.A. 18A:40-41.10*), provides information concerning the use and misuse of opioid drugs in the event that a health care provider prescribes a student-athlete or cheerleader an opioid for a sports-related injury. Student-athletes and cheerleaders participating in an interscholastic sports program (and their parent or guardian, if the student is under age 18) must provide their school district written acknowledgment of their receipt of this fact sheet.

How Do Athletes Obtain Opioids?

In some cases, student-athletes are prescribed these medications. According to research, about a third of young people studied obtained pills from their own previous prescriptions (i.e., an unfinished prescription used outside of a physician's supervision), and 83 percent of adolescents had unsupervised access to their prescription medications.³ It is important for parents to understand the possible hazard of having unsecured prescription medications in their households. Parents should also understand the importance of proper storage and disposal of medications, even if they believe their child would not engage in non-medical use or diversion of prescription medications.

What Are Signs of Opioid Use?

According to the National Council on Alcoholism and Drug Dependence, 12 percent of male athletes and 8 percent of female athletes had used prescription opioids in the 12-month period studied.³ In the early stages of abuse, the athlete may exhibit unprovoked nausea and/or vomiting. However, as he or she develops a tolerance to the drug, those signs will diminish. Constipation is not uncommon, but may not be reported. One of the most significant indications of a possible opioid addiction is an athlete's decrease in academic or athletic performance, or a lack of interest in his or her sport. If these warning signs are noticed, best practices call for the student to be referred to the appropriate professional for screening,⁴ such as provided through an evidence-based practice to identify problematic use, abuse and dependence on illicit drugs (e.g., Screening, Brief Intervention, and Referral to Treatment (SBIRT)) offered through the [New Jersey Department of Health](#).

What Are Some Ways Opioid Use and Misuse Can Be Prevented?

According to the New Jersey State Interscholastic Athletic Association (NJSIAA) Sports Medical Advisory Committee chair, John P. Kripsak, D.O., "Studies indicate that about 80 percent of heroin users started out by abusing narcotic painkillers."

According to NJSIAA Sports Medical Advisory Committee chair, John P. Kripsak, D.O., "Studies indicate that about 80 percent of heroin users started out by abusing narcotic painkillers."

The Sports Medical Advisory Committee, which includes representatives of NJSIAA member schools as well as experts in the field of healthcare and medicine, recommends the following:

- The pain from most sports-related injuries can be managed with non-narcotic medications such as acetaminophen, non-steroidal anti-inflammatory medications like ibuprofen, naproxen or aspirin. Read the label carefully and always take the recommended dose, or follow your doctor's instructions. More is not necessarily better when taking an over-the-counter (OTC) pain medication, and it can lead to dangerous side effects.⁴
- Ice therapy can be utilized appropriately as an anesthetic.
- Always discuss with your physician exactly what is being prescribed for pain and request to avoid narcotics.
- In extreme cases, such as severe trauma or post-surgical pain, opioid pain medication should not be prescribed for more than five days at a time;
- Parents or guardians should always control the dispensing of pain medications and keep them in a safe, non-accessible location; and
- Unused medications should be disposed of immediately upon cessation of use. Ask your pharmacist about drop-off locations or home disposal kits like Deterra or Medsaway.

Number of Injuries Nationally in 2012 Among Athletes 19 and Under from 10 Popular Sports

(Based on data from U.S. Consumer Product Safety Commission's National Electronic Injury Surveillance System)

SOURCE: USA TODAY (Janet Loehrke) Survey of Emergency Room Visits

Even With Proper Training and Prevention, Sports Injuries May Occur

There are two kinds of sports injuries. Acute injuries happen suddenly, such as a sprained ankle or strained back. Chronic injuries may happen after someone plays a sport or exercises over a long period of time, even when applying overuse-preventative techniques.⁵

Athletes should be encouraged to speak up about injuries, coaches should be supported in injury-prevention decisions, and parents and young athletes are encouraged to become better educated about sports safety.⁶

What Are Some Ways to Reduce the Risk of Injury?

Half of all sports medicine injuries in children and teens are from overuse. An overuse injury is damage to a bone, muscle, ligament, or tendon caused by repetitive stress without allowing time for the body to heal. Children and teens are at increased risk for overuse injuries because growing bones are less resilient to stress. Also, young athletes may not know that certain symptoms are signs of overuse.

The best way to deal with sports injuries is to keep them from happening in the first place. Here are some recommendations to consider:

PREPARE Obtain the preparticipation physical evaluation prior to participation on a school-sponsored interscholastic or intramural athletic team or squad.

CONDITIONING Maintain a good fitness level during the season and offseason. Also important are proper warm-up and cooldown exercises.

PLAY SMART Try a variety of sports and consider specializing in one sport before late adolescence to help avoid overuse injuries.

ADEQUATE HYDRATION Keep the body hydrated to help the heart more easily pump blood to muscles, which helps muscles work efficiently.

TRAINING Increase weekly training time, mileage or repetitions no more than 10 percent per week. For example, if running 10 miles one week, increase to 11 miles the following week. Athletes should also cross-train and perform sport-specific drills in different ways, such as running in a swimming pool instead of only running on the road.

REST UP Take at least one day off per week from organized activity to recover physically and mentally. Athletes should take a combined three months off per year from a specific sport (may be divided throughout the year in one-month increments). Athletes may remain physically active during rest periods through alternative low-stress activities such as stretching, yoga or walking.

PROPER EQUIPMENT Wear appropriate and properly fitted protective equipment such as pads (neck, shoulder, elbow, chest, knee, and shin), helmets, mouthpieces, face guards, protective cups, and eyewear. Do not assume that protective gear will prevent all injuries while performing more dangerous or risky activities.

Resources for Parents and Students on Preventing Substance Misuse and Abuse

The following list provides some examples of resources:

National Council on Alcoholism and Drug Dependence – NJ promotes addiction treatment and recovery.

New Jersey Department of Health, Division of Mental Health and Addiction Services is committed to providing consumers and families with a wellness and recovery-oriented model of care.

New Jersey Prevention Network includes a [parent's quiz](#) on the effects of opioids.

Operation Prevention Parent Toolkit is designed to help parents learn more about the opioid epidemic, recognize warning signs, and open lines of communication with their children and those in the community.

Parent to Parent NJ is a grassroots coalition for families and children struggling with alcohol and drug addiction.

Partnership for a Drug Free New Jersey is New Jersey's anti-drug alliance created to localize and strengthen drug-prevention media efforts to prevent unlawful drug use, especially among young people.

The Science of Addiction: The Stories of Teens shares common misconceptions about opioids through the voices of teens.

Youth IMPACTING NJ is made up of youth representatives from coalitions across the state of New Jersey who have been impacting their communities and peers by spreading the word about the dangers of underage drinking, marijuana use, and other substance misuse.

GUIDELINE FOR PRESCRIBING OPIOIDS FOR CHRONIC PAIN

IMPROVING PRACTICE THROUGH RECOMMENDATIONS

CDC's *Guideline for Prescribing Opioids for Chronic Pain* is intended to improve communication between providers and patients about the risks and benefits of opioid therapy for chronic pain, improve the safety and effectiveness of pain treatment, and reduce the risks associated with long-term opioid therapy, including opioid use disorder and overdose. The Guideline is not intended for patients who are in active cancer treatment, palliative care, or end-of-life care.

DETERMINING WHEN TO INITIATE OR CONTINUE OPIOIDS FOR CHRONIC PAIN

1

Nonpharmacologic therapy and nonopioid pharmacologic therapy are preferred for chronic pain. Clinicians should consider opioid therapy only if expected benefits for both pain and function are anticipated to outweigh risks to the patient. If opioids are used, they should be combined with nonpharmacologic therapy and nonopioid pharmacologic therapy, as appropriate.

2

Before starting opioid therapy for chronic pain, clinicians should establish treatment goals with all patients, including realistic goals for pain and function, and should consider how opioid therapy will be discontinued if benefits do not outweigh risks. Clinicians should continue opioid therapy only if there is clinically meaningful improvement in pain and function that outweighs risks to patient safety.

3

Before starting and periodically during opioid therapy, clinicians should discuss with patients known risks and realistic benefits of opioid therapy and patient and clinician responsibilities for managing therapy.

CLINICAL REMINDERS

- Opioids are not first-line or routine therapy for chronic pain
- Establish and measure goals for pain and function
- Discuss benefits and risks and availability of nonopioid therapies with patient

U.S. Department of
Health and Human Services
Centers for Disease
Control and Prevention

LEARN MORE | www.cdc.gov/drugoverdose/prescribing/guideline.html

OPIOID SELECTION, DOSAGE, DURATION, FOLLOW-UP, AND DISCONTINUATION

CLINICAL REMINDERS

- **Use immediate-release opioids when starting**
- **Start low and go slow**
- **When opioids are needed for acute pain, prescribe no more than needed**
- **Do not prescribe ER/LA opioids for acute pain**
- **Follow-up and re-evaluate risk of harm; reduce dose or taper and discontinue if needed**

4

When starting opioid therapy for chronic pain, clinicians should prescribe immediate-release opioids instead of extended-release/long-acting (ER/LA) opioids.

5

When opioids are started, clinicians should prescribe the lowest effective dosage. Clinicians should use caution when prescribing opioids at any dosage, should carefully reassess evidence of individual benefits and risks when considering increasing dosage to ≥ 50 morphine milligram equivalents (MME)/day, and should avoid increasing dosage to ≥ 90 MME/day or carefully justify a decision to titrate dosage to ≥ 90 MME/day.

6

Long-term opioid use often begins with treatment of acute pain. When opioids are used for acute pain, clinicians should prescribe the lowest effective dose of immediate-release opioids and should prescribe no greater quantity than needed for the expected duration of pain severe enough to require opioids. Three days or less will often be sufficient; more than seven days will rarely be needed.

7

Clinicians should evaluate benefits and harms with patients within 1 to 4 weeks of starting opioid therapy for chronic pain or of dose escalation. Clinicians should evaluate benefits and harms of continued therapy with patients every 3 months or more frequently. If benefits do not outweigh harms of continued opioid therapy, clinicians should optimize other therapies and work with patients to taper opioids to lower dosages or to taper and discontinue opioids.

ASSESSING RISK AND ADDRESSING HARMS OF OPIOID USE

8

Before starting and periodically during continuation of opioid therapy, clinicians should evaluate risk factors for opioid-related harms. Clinicians should incorporate into the management plan strategies to mitigate risk, including considering offering naloxone when factors that increase risk for opioid overdose, such as history of overdose, history of substance use disorder, higher opioid dosages (≥ 50 MME/day), or concurrent benzodiazepine use, are present.

9

Clinicians should review the patient's history of controlled substance prescriptions using state prescription drug monitoring program (PDMP) data to determine whether the patient is receiving opioid dosages or dangerous combinations that put him or her at high risk for overdose. Clinicians should review PDMP data when starting opioid therapy for chronic pain and periodically during opioid therapy for chronic pain, ranging from every prescription to every 3 months.

10

When prescribing opioids for chronic pain, clinicians should use urine drug testing before starting opioid therapy and consider urine drug testing at least annually to assess for prescribed medications as well as other controlled prescription drugs and illicit drugs.

11

Clinicians should avoid prescribing opioid pain medication and benzodiazepines concurrently whenever possible.

12

Clinicians should offer or arrange evidence-based treatment (usually medication-assisted treatment with buprenorphine or methadone in combination with behavioral therapies) for patients with opioid use disorder.

CLINICAL REMINDERS

- **Evaluate risk factors for opioid-related harms**
- **Check PDMP for high dosages and prescriptions from other providers**
- **Use urine drug testing to identify prescribed substances and undisclosed use**
- **Avoid concurrent benzodiazepine and opioid prescribing**
- **Arrange treatment for opioid use disorder if needed**

Common signs of opioid abuse

1

Falling asleep at inappropriate times (in class, during lunch, etc.)

4

Difficulty focusing; inability to concentrate on tasks

2

Withdrawing from commitments and activities (missing practice, etc.)

5

Changes in appearance (flushing of the face and neck, weight loss, etc.)

3

Dramatic mood swings (anger, anxiety, secretive behaviour)

6

Behavioural markers (frequent scratching, slurred speech, drooping eyes, etc.)

**If you suspect
a friend or
teammate is
abusing opioid
painkillers...**

- Visit the Partnership for a Drug-Free NJ (www.drugfreenj.org) and educate yourself about opioid abuse. The more you know, the more helpful you'll be.
- Realize you must speak up, and quickly. Telling someone isn't disloyal, and it might save a life.
- If you're able to discuss the situation with your friend, make them aware of Narcotics Anonymous and SMART Recovery.
- Don't give up. Recovery can take a long time, so be someone your friend can lean on throughout the process.

Get the Facts

Short Term Use

FACT

After taking opioids for just 5 days in a row, a person becomes more likely to take them long-term.¹

Opioids can be addictive even if only taken for a short period of time.

Level of Pain Relief

FACT

Opioids provide an average of 20-30% pain relief when used for pain lasting less than three months. Options that do not involve opioids may provide enough pain relief while avoiding the risks of opioids.²

Opioids don't take away pain completely.

Kidney Stone Pain

FACT

Nonsteroidal anti-inflammatory drugs (NSAIDs), like ibuprofen and naproxen, work just as well as opioids (and sometimes better) for kidney stone pain.³

Opioids aren't the only treatment for acute pain from kidney stones.

Get the Facts

Back Pain Relief

FACT

Naproxen taken alone relieves acute low back pain and improves function just as well as when it is combined with an opioid or muscle relaxer.⁴

Opioids aren't the most effective treatment for acute low back pain.

Healing From a Broken Bone

FACT

After a minor fracture, nonsteroidal anti-inflammatory drugs (NSAIDs), like ibuprofen and naproxen, provide adequate pain and relief and allow bones to heal, without introducing the risks side effects of opioids.⁵ As with any medicine, NSAIDs have side effects. Doctors can offer the safest, most appropriate and effective care for their patients.

Bones can heal properly after fractures, even when taking NSAIDs for pain.
